The MAZU-Agric Platform: From Agricultural Remote Sensing in Shaanxi to Broader Applications

LIU Yadong

Shaanxi Provincial Meteorological Bureau

CONTENTS

- 1** **Brief Introduction to MAZU-Agric**
- 2** **Application of Satellite Remote Sensing in Shaanxi Province**

The Challenge

- Currently, only half of the the WMO members have multi-hazard early warning systems
- One-third of the global population still lacks access to early warning information, representing a major challenge in responding to meteorological disasters

The EW4All initiative

- Launched by UN Secretary-General António Guterres in 2022
- To ensure everyone is protected from extreme weather, water, or climate events through early warning systems by the end of 2027

MAZU: China's Joint Action for EW4All

- **Launched by CMA** at the opening ceremony of the World AI Conference on July 26 2025
- “Ensuring universal access to meteorological early warning systems is not only a shared vision of the global community, but also an important mission of China’s meteorological departments.”

——CHEN Zhenlin, Administrator of CMA

MAZU-Agric: Extending MAZU to Agriculture

With a focus on agriculture, it establishes a technological foundation “Zhi Tian (知天)”, and an application service “Er Zuo (而作)”

MAZU-Agric Launch Events

- **24 Sep 2025, Yangling:** Launched at the National Conference on Agricultural and Meteorological S&T Innovation Exchange and Promotion
- **25 Oct 2025, Yanling:** Launched at the SCO Modern Agriculture Development Roundtable

CONTENTS

- 1** Brief Introduction on MAZU-Agric
- 2** Application of Satellite Remote Sensing in Shaanxi Province

AOMSUC-15 2025 FYSUC

Leveraging Satellite Technology for Sustainable Development

Shaanxi Province, with its unique geography encompassing the Qinling Mountains and the Loess Plateau, has adopted satellite technology to promote sustainable development.

Key Infrastructure

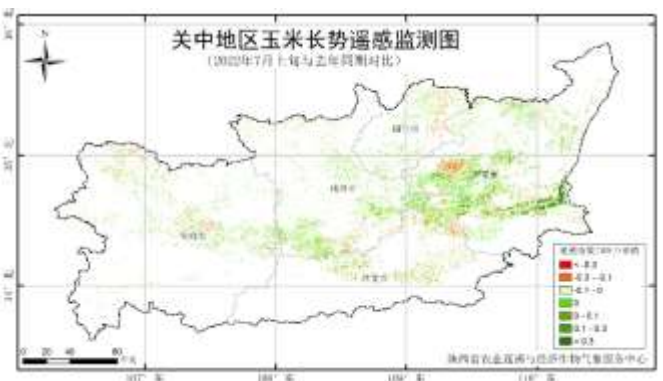

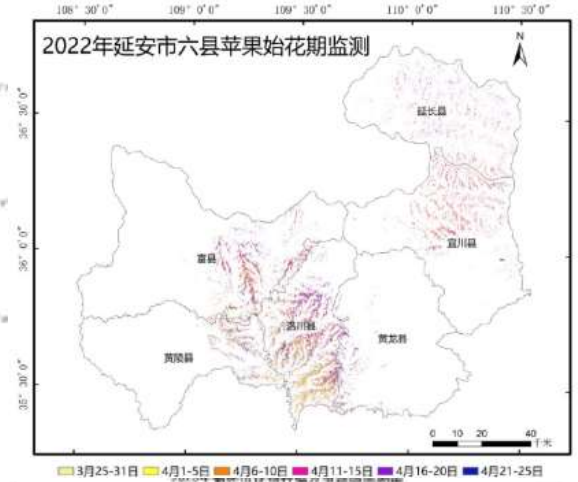

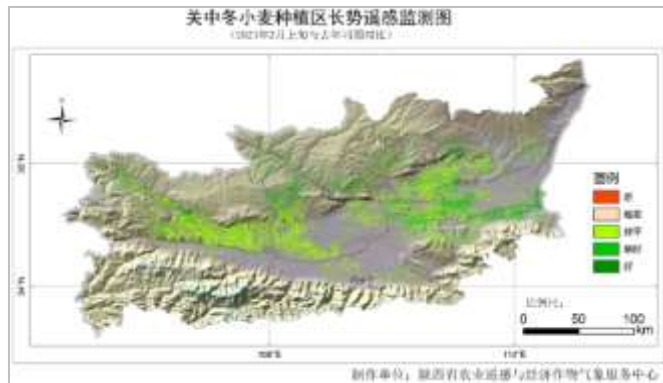

- **Receiving Stations:** 1 polar-orbiting and 2 geostationary satellite direct receiving stations
- **Validation Sites:** 3 validation sites in Shenmu (Yulin), Songduo Mountain (Shangluo), and Taibai (Baoji)
- **Processing Platform:** a multi-source satellite data preprocessing and validation platform

AOMSUC-15 2025 FYSUC

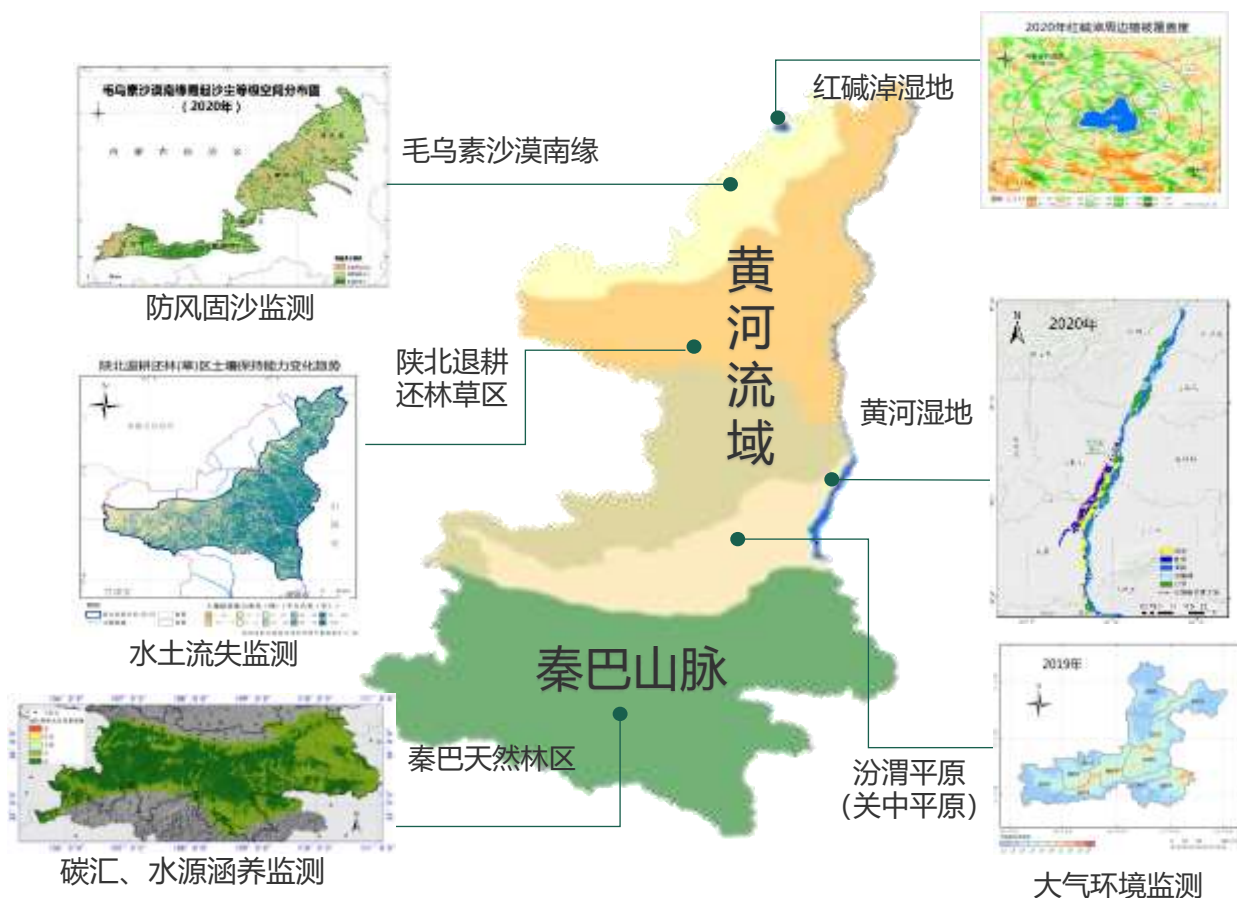

➤ Mission 1: Food Security & Specialized Agriculture

- **Staple Crop Monitoring:** Distribution, growth status and harvest progress of **winter wheat, corn, and soybean**
- **Specialized Crop Monitoring:** Apple flowering and quality (hyperspectral remote sensing); distribution of **apple and kiwifruit**

➤ Mission 2: Ecological Conservation & Development

Focus on the **Qinling Mountains** and the “**Ji Zi Wan**” area of the Yellow River, conducting green project evaluations to support Shaanxi's ecological promotion

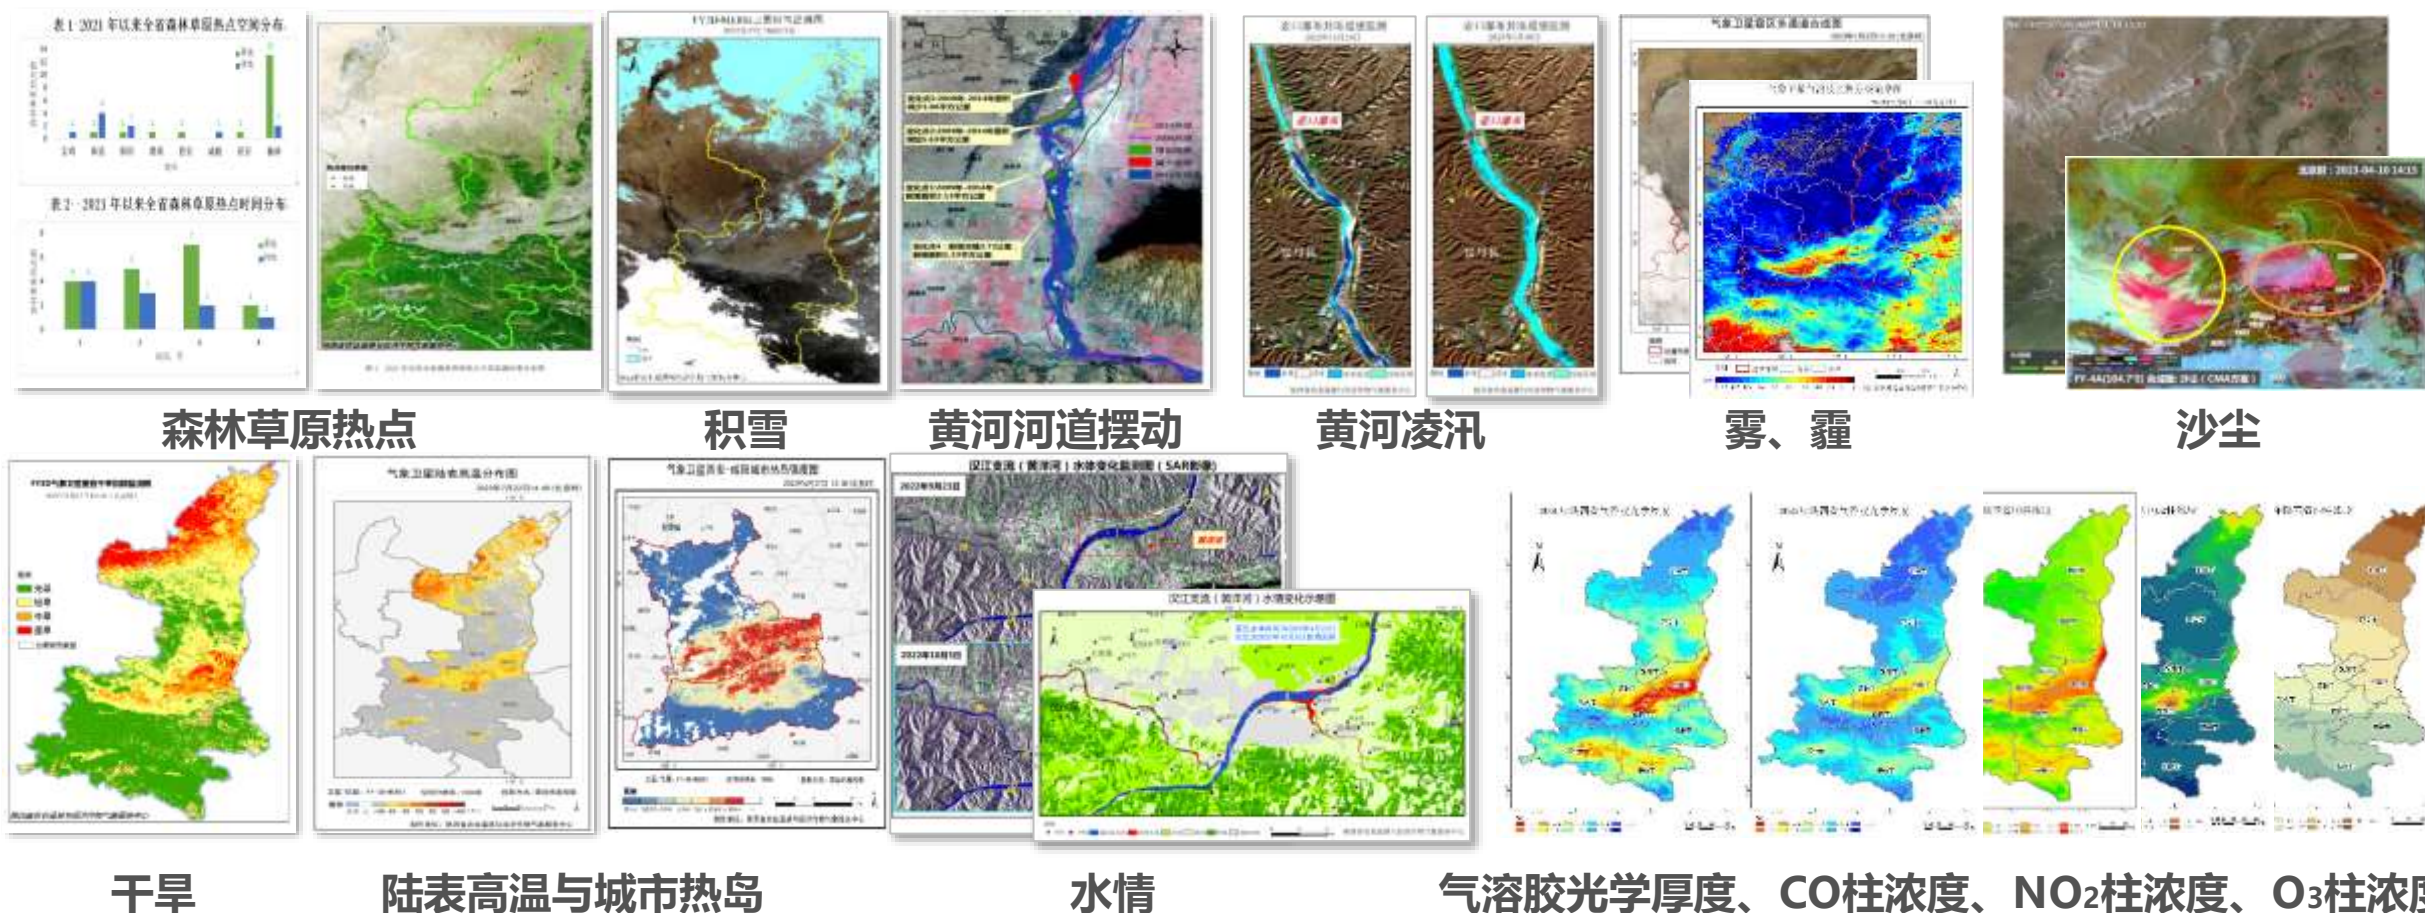

央视《新闻联播》：陕西省委书记刘国中向习近平总书记介绍陕西省生态环境治理情况。

AOMSUC-15 2025 FYSUC

➤ Mission 3: Disaster Prevention and Mitigation

To address Shaanxi's regional characteristics and key concerns, we conduct satellite remote sensing monitoring for **fire hotspot, ice floods, high land surface temperature (LST), snow cover, heavy fog, dust, haze**

➤ Application Scenario 1: Hyperspectral Remote Sensing in Agriculture

• Developing a Kiwifruit Heat Stress Assessment Model

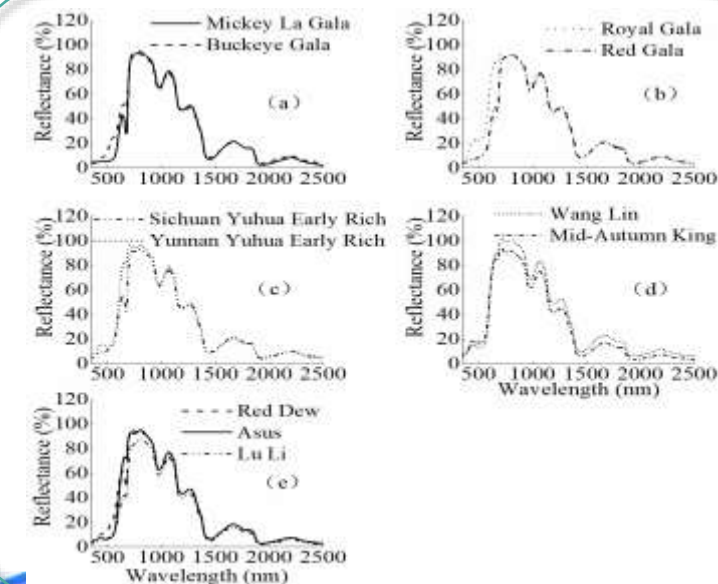

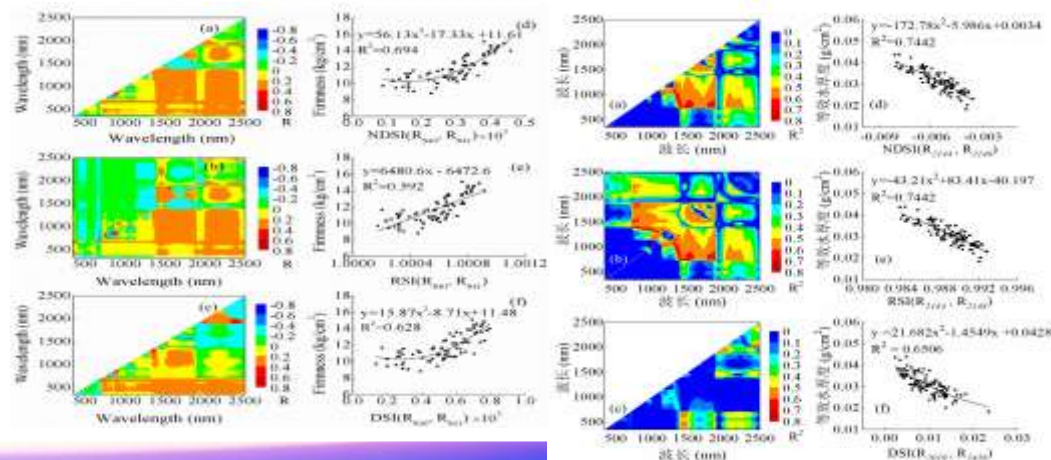

Using data mining techniques to explore the relationship between hyperspectral remote sensing responses and kiwifruit physiological indicators under heat stress, identifying spectral-biochemical correlations.

• Building an Apple Quality Estimation Model

Combining hyperspectral technology with advanced algorithms to measure spectral features and internal quality parameters (soluble solids, acidity, firmness), developing climate-specific spectral indices for quality prediction.

• Creating a Winter Wheat Phenology Monitoring Model

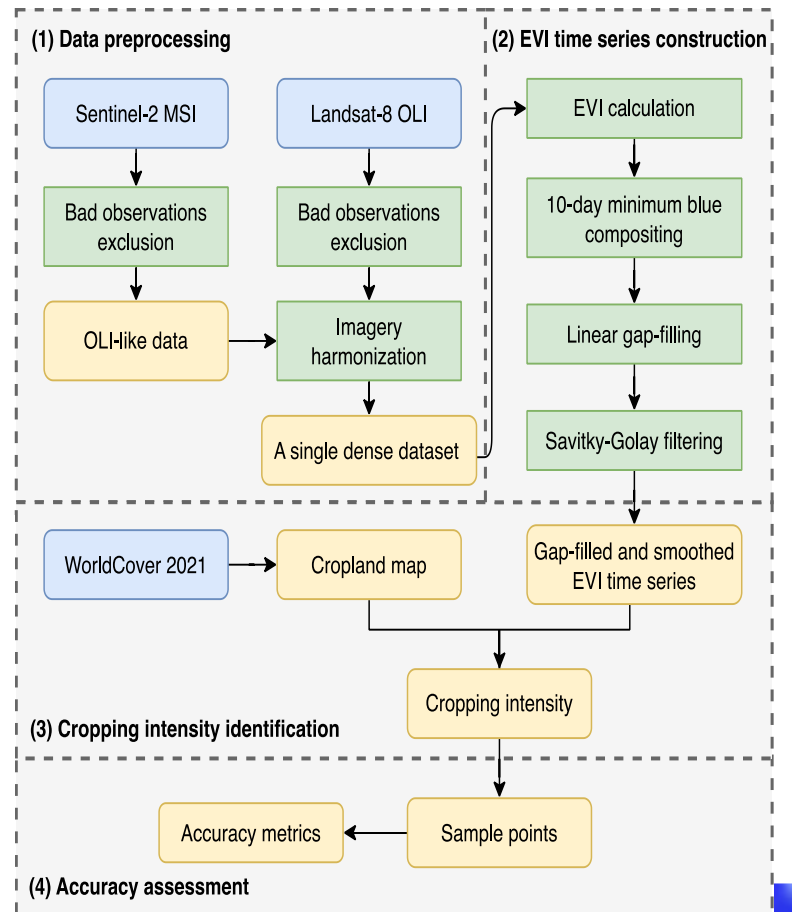

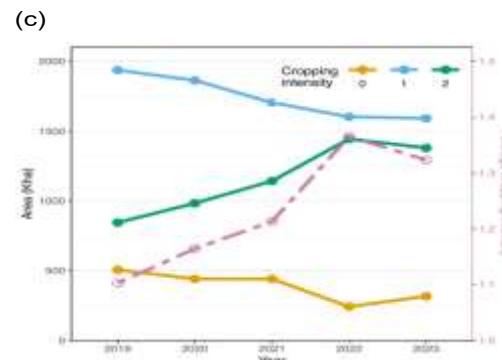

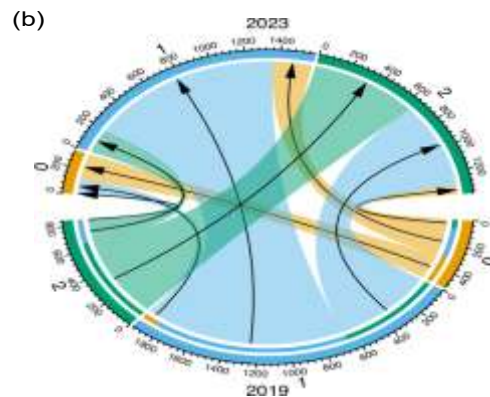

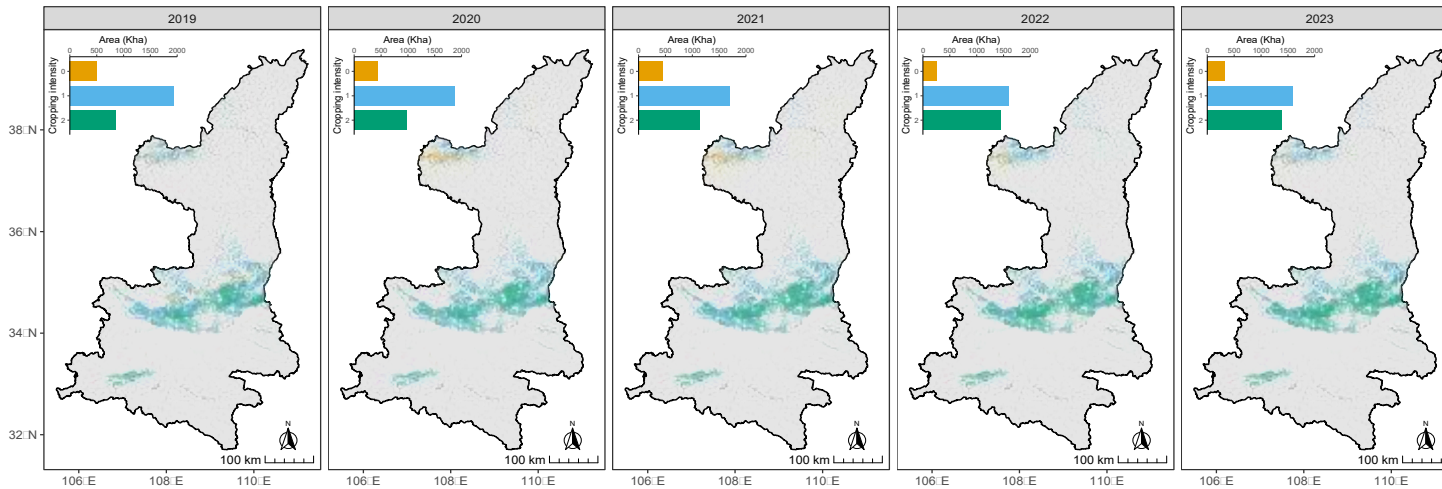

Developing spectral indices sensitive to growth stages, and enabling rapid, non-destructive monitoring of key phenological phases.

AOMSUC-15 2025 FYSUC

➤ Application Scenario 2: Monitoring Cropping Intensity

- **Enhanced Vegetation Index (EVI) Dataset:** Integrated multi-source high-resolution satellite data to generate a long-term seamless EVI dataset
- **High-Precision Monitoring:** Achieved >96% identification accuracy using machine learning

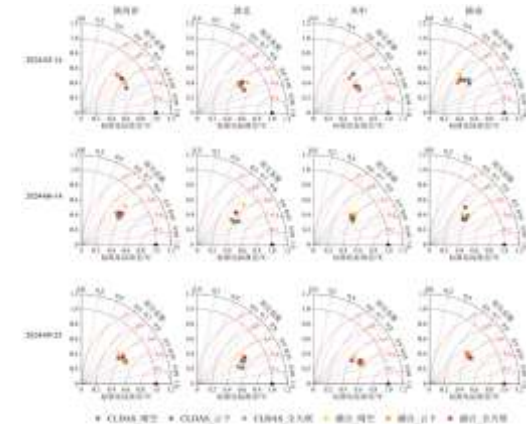

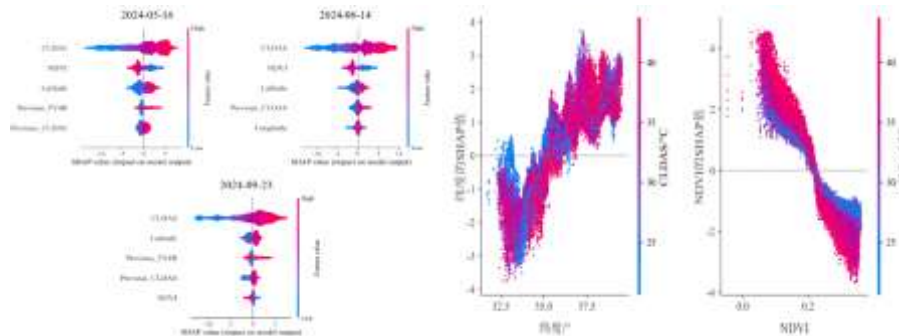

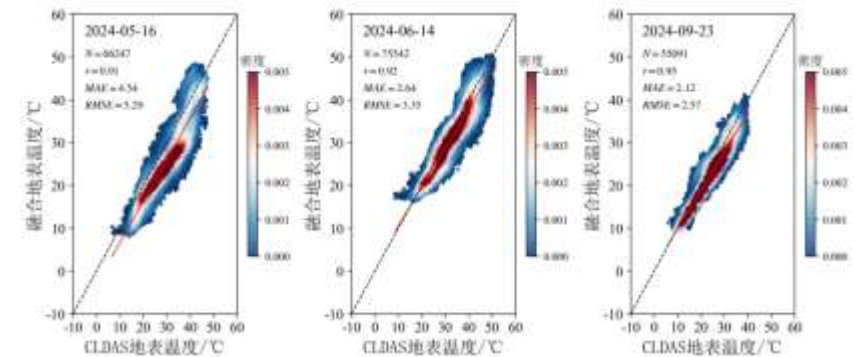

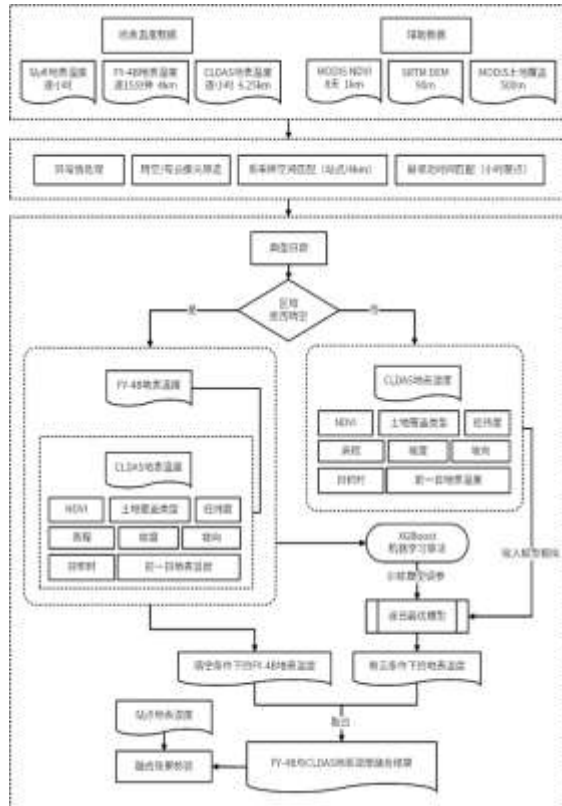

AOMSUC-15 2025 FYSUC

➤ Application Scenario 3: FY-4B LST Validation and Application

- **Multi-Source Data Foundation:** Combines FY-4B LST products, CLDAS, NDVI, DEM, land cover, and ground observations for robust LST reconstruction
- **XGBoost Algorithm for Cloud Obscuration:** Fusion with clear-sky data enhances data completeness and accuracy
- **All-Weather Monitoring:** Validated fusion methods enable operational, all-weather LST monitoring

AOMSUC-15 2025 FYSUC

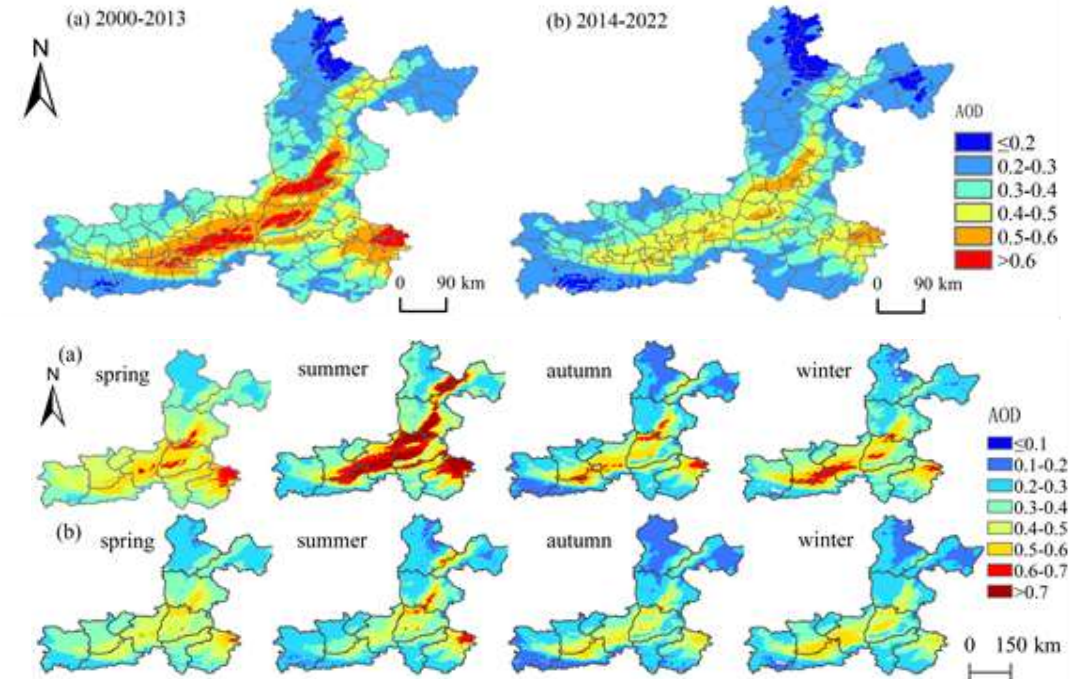

➤ Application Scenario 4: Aerosol Optical Depth (AOD) Retrieval

- **AOD Retrieval Method:** Utilizes **Gaofen data** (GF-1/WFV, GF-4/PMS), through radiometric calibration, apparent reflectance calculation, solar-satellite-earth geometry determination, and look-up table construction
- **Accuracy Assessment:** High consistency ($R^2 > 0.85$) with MODIS (Aqua/Terra) products

Spectral Response Function of the Gaofen Satellite sensors

Mean AOD Distribution in the Fenwei Plain (2000-2022)

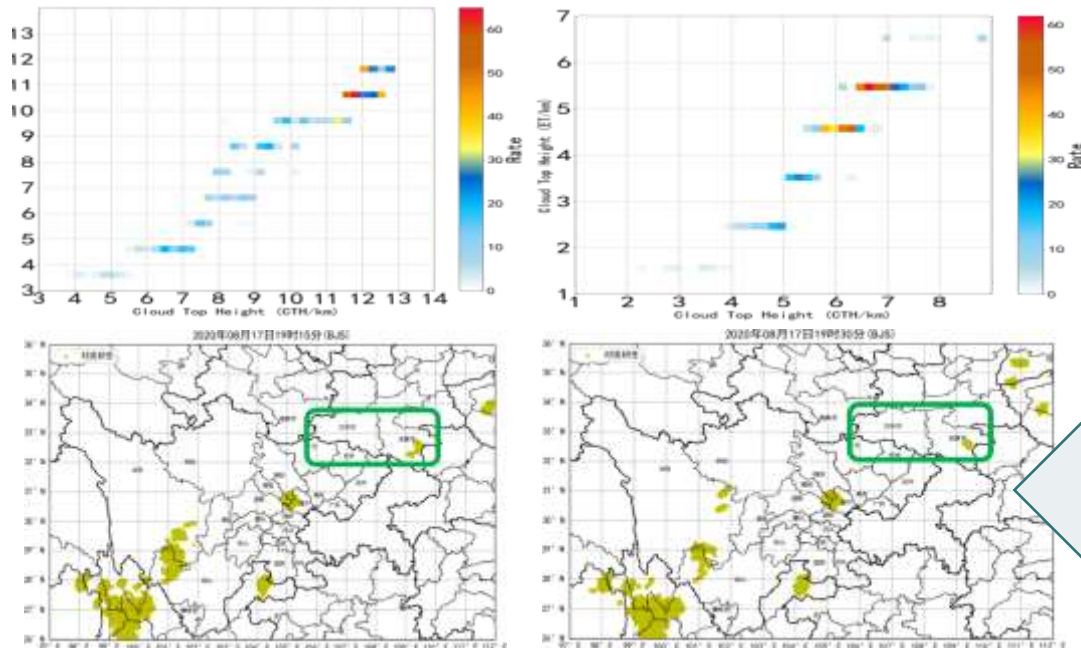

AOMSUC-15 2025 FYSUC

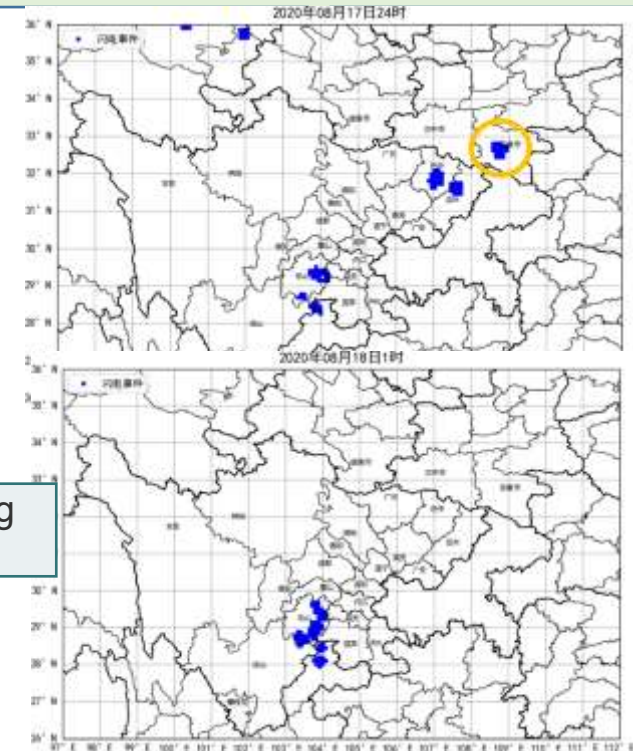

➤ Application Scenario 5: Convective Initiation (CI) Detection

- FY-4A Cloud Top Height (CTH) products enhance monitoring of heavy precipitation clouds in Qinling Mountains
- Developed key technologies for CI identification in megacities using FY-4A, integrating deep learning with a localized adaptation of the SAFNWC/PPS CI monitoring algorithms
- Achieving a **<30% False Alarm Rate (FAR)** of for mesoscale convective systems

Scatter Density of Weather Radar ET and FY-4A CTH

FY-4A Detection of Lightning Associated with Heavy Precipitation

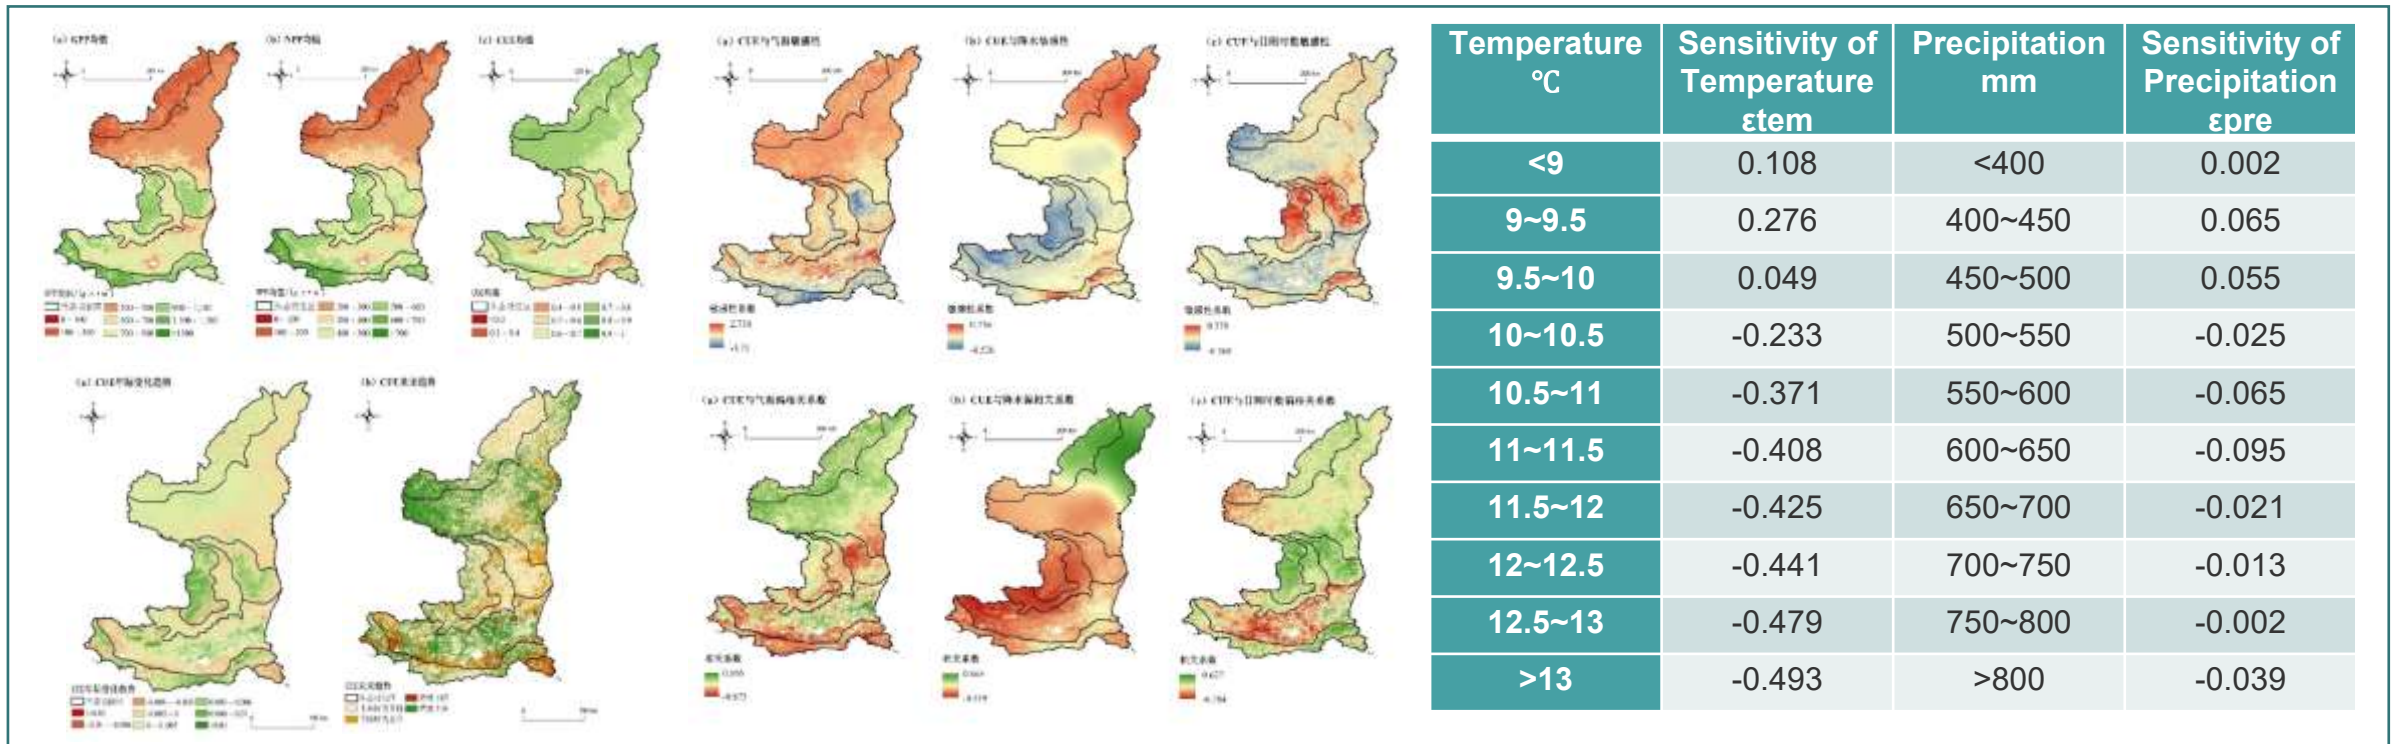

Detection of CI Using FY-4A Satellite

➤ Application Scenario 6: Vegetation Carbon Use Efficiency (CUE)

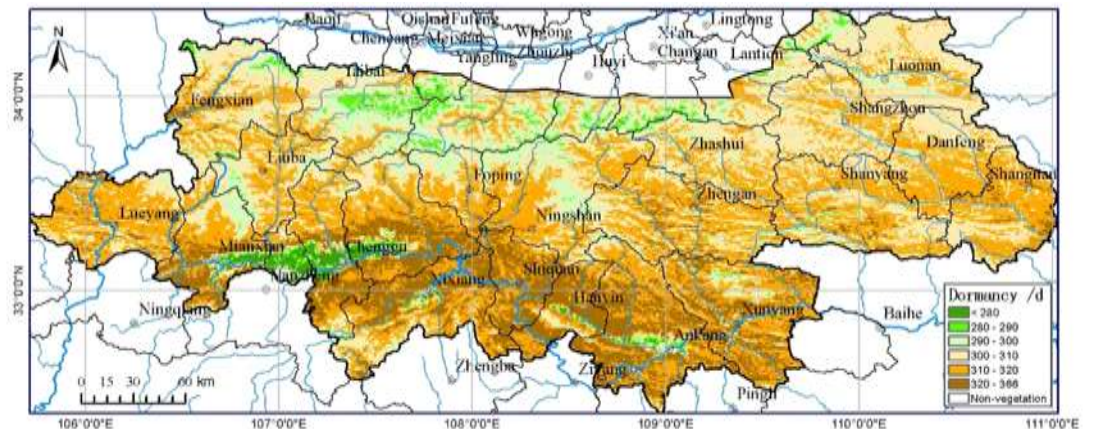

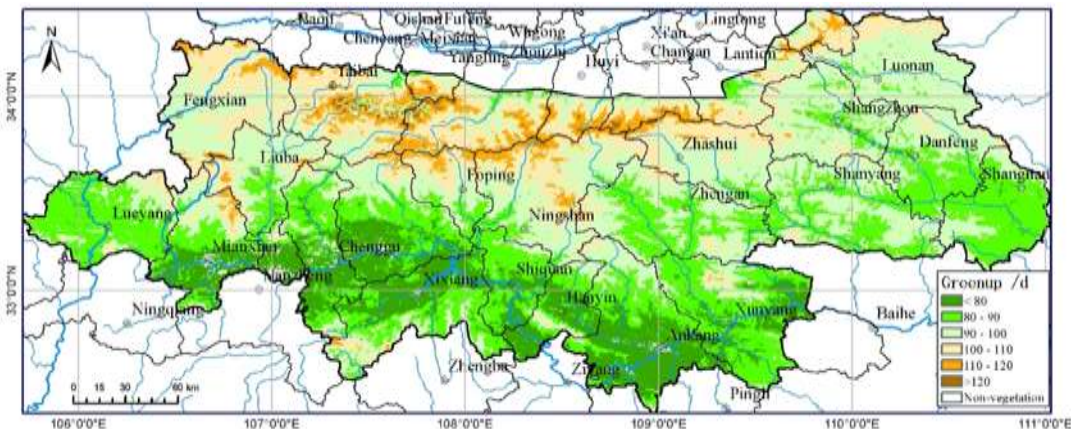

- **Spatiotemporal Patterns of Vegetation CUE:** Analyzed temporal-spatial characteristics and future trends of vegetation CUE in the Shaanxi section of the Yellow River Basin.
- **Climate Sensitivity of Vegetation CUE:** Derived **sensitivity coefficients** for temperature/precipitation, and identified **sensitivity thresholds** (Temperature: 0.68°C/CUE unit; Precipitation: 12 mm/CUE unit)

AOMSUC-15 2025 FYSUC

➤ Application Scenario 7: Climate and Eco-environmental Changes in Qinling

- Utilized climate and eco-environmental data from ground observations and satellite retrievals
- Established region-specific monitoring** indicators suitable for Eco-environment assessment in the Qinling Mountains
- Investigated trends of key eco-environmental factors:** carbon sequestration capacity in forested areas, water conservation capacity, and the upper distribution limit of *Larix potaninii* (Taibai larch)

Thanks for your attention!
